Open problems (stated for $n \times n$ matrices)

- nonlinear lower bounds on XOR-complexity
- SUM-complexity of the matrix K: $\quad n \preceq \mathsf{SUM}(K) \preceq n \log n$
- depth-2 complexity of the matrix D:

$$n^{1.16} \prec \mathsf{OR}_2(D) \leq \mathsf{SUM}_2(D) \prec n^{1.28} \qquad \boxed{\text{JS13}}$$

$$\mathsf{OR}_2(D) \prec n^{1.17} \qquad \text{D. Chistikov, Sz. Iván, A. Lubiw,}$$
$$\text{J. Shallit (2015)}$$

- verify the rank conjecture: $\quad \mathsf{L}(A \otimes B) \geq \mathrm{rk}(A) \cdot \mathsf{L}(B) \quad$?
- does it hold that for a matrix A, $\mathsf{XOR}(A)/\mathsf{OR}(A) \to \infty$?
- construct a matrix A such that $\mathsf{SUM}_2(\overline{A})/\mathsf{SUM}_2(A) \to \infty$
- investigate L_2/L separations:

$$\frac{\mathsf{OR}_2(A)}{\mathsf{OR}(A)} \succeq \sqrt{n/\log n}, \qquad \frac{\mathsf{XOR}_2(B)}{\mathsf{XOR}(B)} \succ n^{0.3} \qquad \boxed{\text{JS13-17}}$$
